Application packaging

Application packaging is the activity of getting applications ready for deployment
by compiling all files, configurations, and dependencies into a common format.
This makes it possible to install and run the
application in a uniform way across numerous systems and environments.
It facilitates easier deployment, efficient update support, and system
security through standardized installation procedures. Standard formats are `.msi` for
Windows, whereas contemporary methods usually encompass containerization
with the use of Docker.

Steps to install MSIX

1. Open the Microsoft Store

2. Sign In

3.Search for the App

4.Select the App

5.Click "Get" or "Install"

6.Wait for Installation

7.Launch the App
